

Product improvement: Calibration Kits and Calibration Components

Rosenberger re-worked the complete portfolio of calibration kits and single calibration components concerning design, electrical specifications and especially the product calibration and documentation on paper and USB stick.

The Rosenberger calibration laboratory offers two types of calibration - factory calibration and accredited calibration.

Each calibration kit comes with a calibration certificate. Measurement results and uncertainties for all calibration standards, gauges and torque wrenches are included. Standard calibration is the factory calibration.

As an option accredited calibration is carried out under DAkks accreditation: the Rosenberger calibration laboratory is accredited by the German accreditation body DAkks (Deutsche Akkreditierungsstelle) according to DIN EN ISO 17025. Accredited calibration certificates are worldwide accepted to demonstrate that measurement results are traceable to national / international standards.

For information in detail please see the Application Note AN 001 "Calibration Services":
http://www.rosenberger.com/en/downloads/application_note.php

The implementation of this improvement will be placed series by series, ongoing with series RPC-3.50. Until Q2 / 2015 the improvement will be completed for all calibration kit and single calibration components.
